

Accelerometer Data

Group Activity Compositions By Weekday//Weekend
Currently missing sleep, which will be added in the actual plots.

Participant × Session Heatmap

Each row = 1 participant · Sorted by Δ sedentary · Gray = missing session · N=60 shown

Match my participant not delta

Separate color code for delta

Heatmap of Individual Level Longitudinal Changes in Activity Patterns

Left side focuses on a decrease Δ in sedentary behavior

Right side focuses on increase Δ in unbouted MVPA

Next iteration will match by subject across both heatmaps

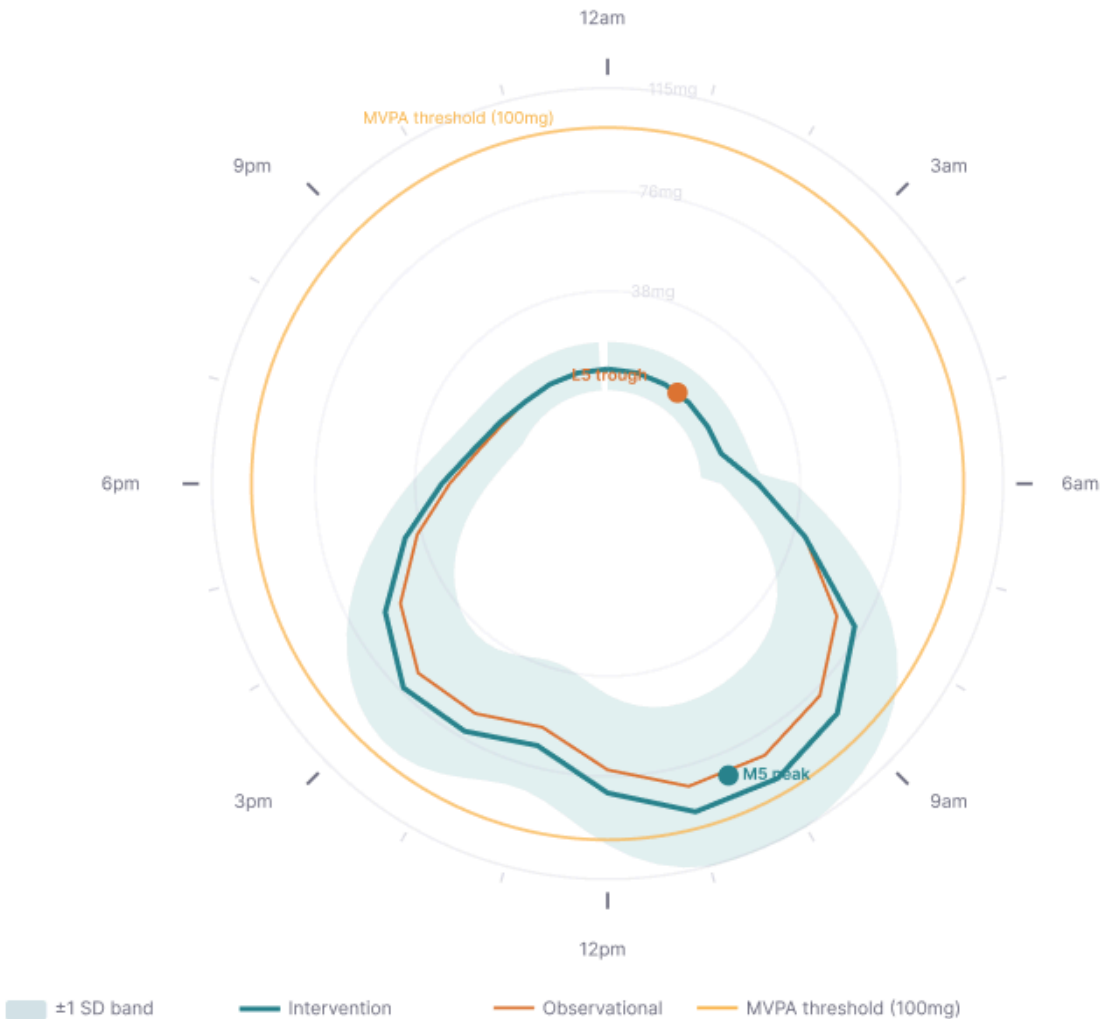

Current line about Intervention/Observational is irrelevant and this will be separate plots for the studies

Radial Activity Clock

Mean acceleration (ENMO) by hour of day · Shading = ± 1 SD · N = 200 participants

Try separate lines for
intervention sessions

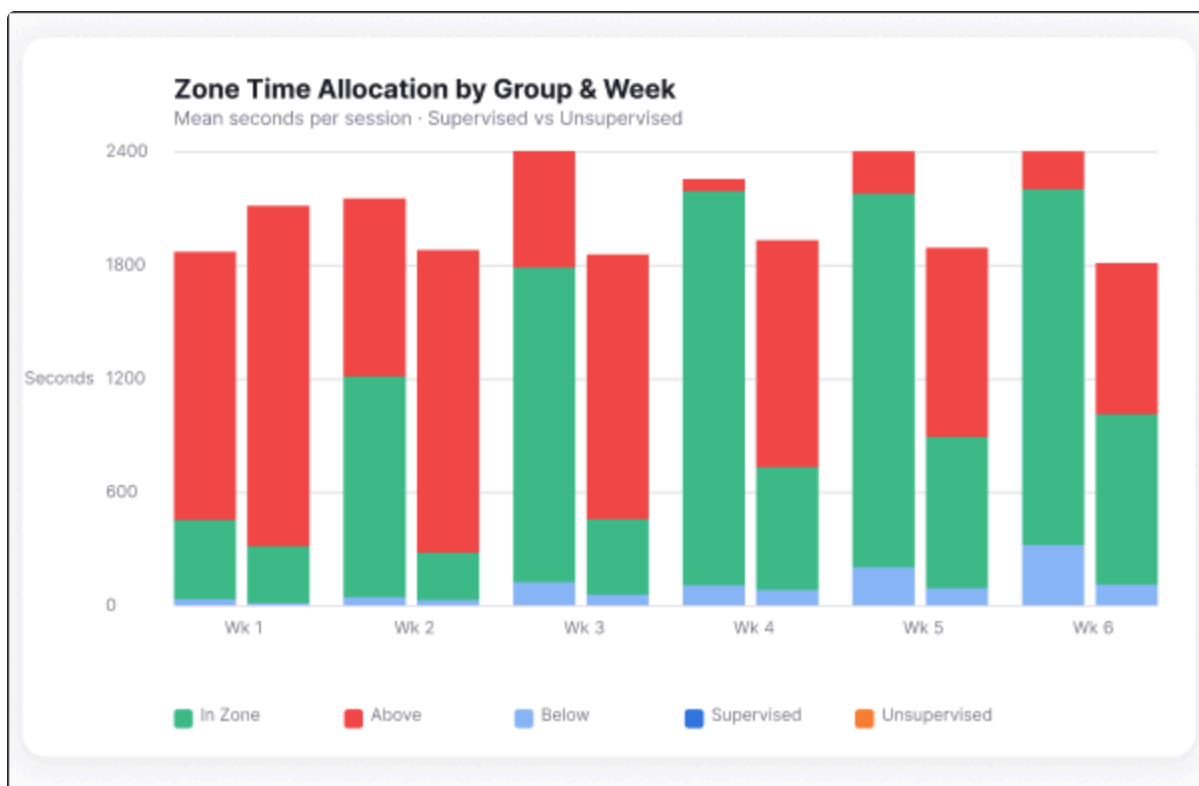

Or other plots and compare
session 1 only

Activity "Clock"

Shows the mean acceleration (ENMO) across the 24 hour cycle split by study. Next iteration will more accurately represent the 4 intervention sessions

Heart Rate Data

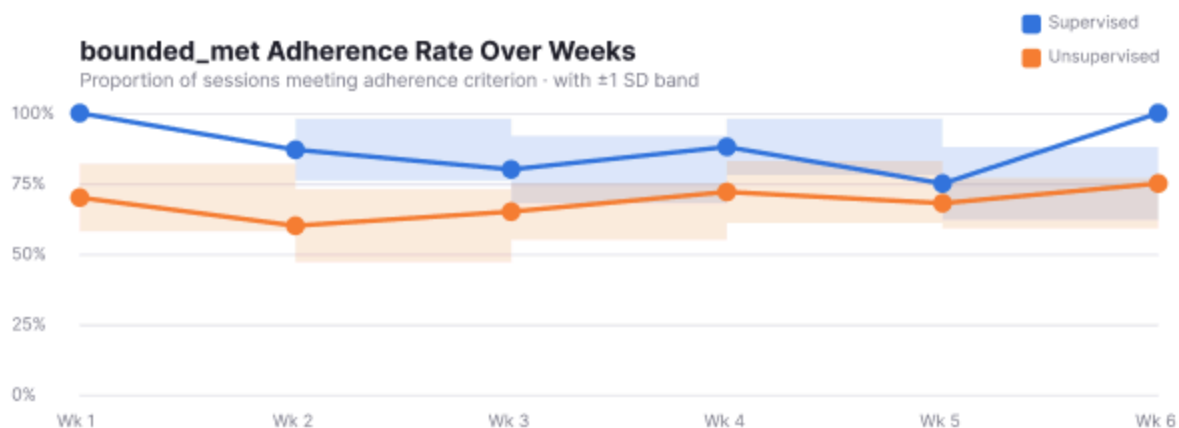

Zone Time Allocation Stacked Bar

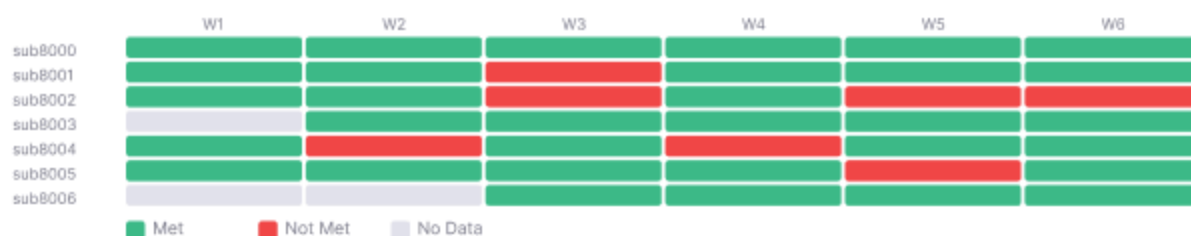

Shows the mean time (s) spent in, above, and below the specified zones by week split by supervised and unsupervised.

bounded_met Adherence Rate Over Weeks

Proportion of sessions meeting adherence criterion - with ± 1 SD band

Individual Adherence Heatmap (bounded_met per subject x week)

Try cutoff for sessions over same week - try 75% and then move down if it looks terrible

Adherence Line Plots and Heatmap

Top shows the proportions of sessions meeting the bounded exercise goal by week split by supervised/unsupervised

Bottom shows the individual adherence levels, next iteration will more accurately represent sessions within each week as a cutoff - starting with 75%.
